

AVENUE 21

AVENUE 21

07.05.2018

AVENUE21 - Who we are

- AVENUE21 is an interdisciplinary research project funded by the Daimler & Benz Foundation and located at TU Wien's future.lab. Our team includes researchers from architecture, architectural theory, urban design, regional planning, sociology and mobility studies.

Ian Hauerjoo, Urban Research

Martin Heger, Transportation Systems Planning

Emilia Bruck, Urban Studies & Planning

Jens Dangschat, Urban Sociology

Alexander Diem, Architecture

Julia Dörner, Sociology

Jonathan Fetka, Spatial Planning

Charlotte Heller, Spatial Planning

Mathias Mittregger, Architectural Theory

Rudolf Scheuvs, Urban Planning

Aggelos Soteropoulos, Mobility & GIS

Andrea Sticker, Urban Sociology

Structure of the presentation

- Main question
- Best practice
- The usecases
- Possible effects on buildings (general)
- The hub

Main questions regarding CAVs, architecture & buildings:

- How to deal with existing buildings in an European city if vehicles can drive automatically?
- What are the potentials for new developments?
- What are the problems (in both cases)?

BEST PRACTICE

07.05.2018

Take a look on previous recommendations for action, some examples:

- BLUEPRINT FOR AUTONOMOUS URBANISM National Association of City Transportation Officials
- BIG's proposal for the Audi Urban Future Award
- AUDI urban future initiative parking garage for Boston area
- Arrowstreet recommendation for a garage redeployment
- FX collaborative Public Square

1 Dedicated Transit Lanes
Dedicated, central lanes could serve light rail, bus, and microtransit, while smaller vehicles could be permitted in narrow access lanes. System-wide reliability and capacity should be the touchstones of tomorrow's transit agencies and street operations.

2 Mobility Hubs
Trunkline transit could integrate seamlessly with point-to-point options. Cities' proactive policies on data sharing would allow for integrated transit options, no matter the provider.

3 The Flex Zone
Freight and small vehicles are could be accommodated at low speeds. The former curbside could become a flex zone alternating between public spaces and loading without delaying or endangering transit users.

07.2 BIG's proposal for the Audi Urban Future Award

- Flexible zoning of street spaces
- Optical activation of the surface for security reasons

07.3 AUDI urban future initiative parking garage for Boston

07.4 Arrowstreet recommendation for a garage with a reuse concept for transitional period

THE USECASES

What are selfdriving Cars? – The usecases

02 Pod Car

Geschichte der Podcar von Robert Cilliers: werden auch PRT als Podcar bezeichnet. Nicht abkürzungen, sondern bewegen sich mit geringen Geschwindigkeiten in ausgetragenen Einzelfahrern, in denen oft nicht alle Muskeln vorhanden sind. Der Zugriff auf Autonomie Steuer erfolgt über ein Interface (touch oder an Keyboard). Auch ist in einer Designphase überholt.

06 AV Privatauto/Vehicle on Demand

06 Autonome Busse

03 Autonomes Shuttle

01 Personal Rapid Transit

Als Personal Rapid Transit oder PRT werden flächen-, schienen- oder strombahnähnliche Transportsysteme bezeichnet, die ohne Stopp Fahrplan, Fahrgäste auf Bestellung zu ihr Ziel bringen. Das Konzept geht auf Fisher (1964) zurück. In Verbindung mit der Entwicklung des Stadtkar von William Allen (1960er) das der Erfinder als „erweitert Fahrzeug“ bezeichnet, ist dies dessen Passagier Personen oder Passagier (Nachrichten) empfangen können während der Fahrt, hat es keine Verkehrslichter.
Das System hat sich in Bereichen mittlerer bis geringer Dichte an. Früher Versionen des Systems wurde als „Automat auf dem sich selbst steuernden „autonomous system“ in den USA entwickelt, angesprochen durch den Urban Mass Transportation Act von 1964. Ziel war es im Gegensatz zu Massenverkehrsmitteln, die Flexibilität des Autos zu haben.

closer distance

further distance

POSSIBLE EFFECTS ON BUILDINGS (GENERAL)

Merge the recommended action in traffic planning on to buildings

- What are the possible mayor impacts on the building itself?

- **The design of the street (shaped by the dominant mode of transport) is intrinsically connected to the circulation within buildings**

Effects on Buildings

Valet Parking Gateway

accessible organic buildings (driving situations humans would avoid and robots don't)

Effects on Buildings

Signaling effect of buildings (Landmark)

Real drive in

AVENUE 21

Existing situation

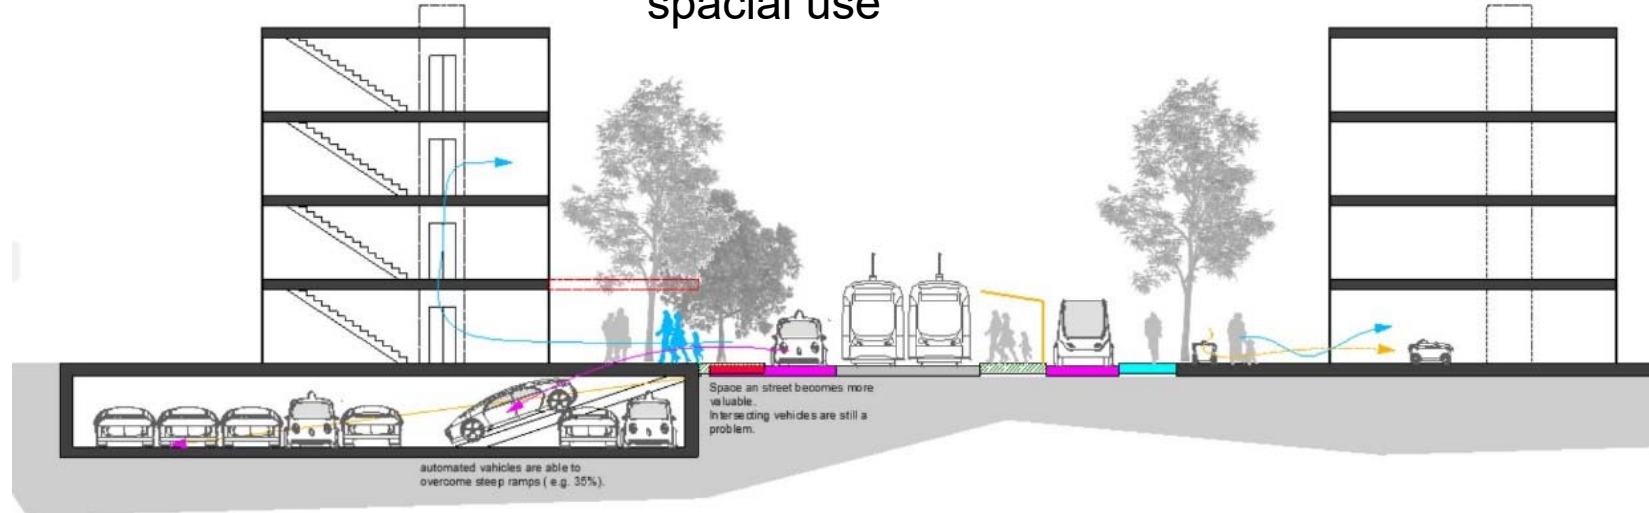

- Traffic takes up most of the street space
- Little space für pedestrians and cyclists
- People enter the building through the garage (not attractive) or via vast parking lot.

07.05.2018

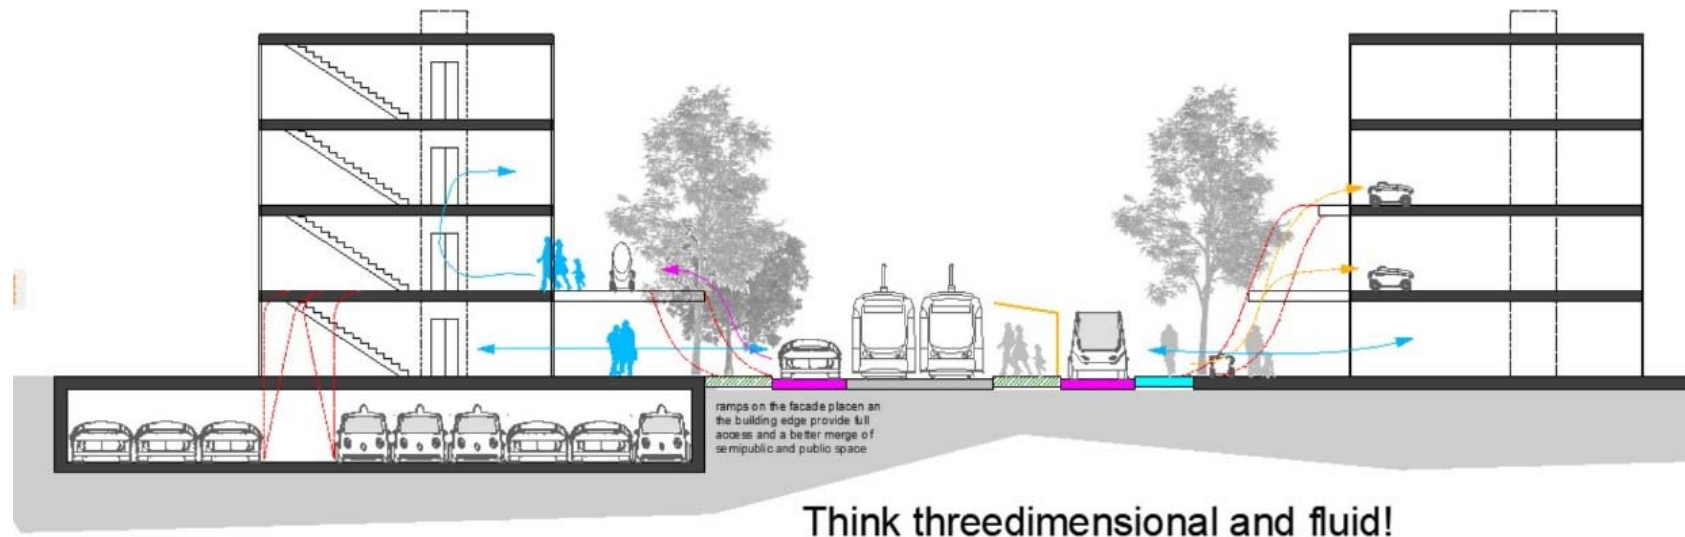

Future situation

- The road will be split into dedicated transit lanes with mobility hubs, and „flex zones“
- There will be more space provided for „active traffic“ (pedestrians ect.)
- **Potential 1 – reimagining the entrance:** valetparking technology – cars can store themselves in existing garages with far higher density
- **Potential 2 – spacial efficiency:** More steep ramps for more efficiency spacial use

Extrapolation of the future situation

- ramps on the facade placed on the building edges provide full access and a better merge of semipublic and public space

Can't we use existing infrastructure?

- At least for transport of goods

08 Last Mile Delivery

THE HUB

07.05.2018

Focus on Hub – Why we also Transfer in the future?

- European cities are historically not dedicated to masses of private vehicles
- Urban policy in Europe aims to public transport
- Congestion
- Cost savings (purchase, fuel, car hire costs)
- Carbon Footprint

=> Transfer points (hub) will continue to play an important role in the future!

Planning the future: make coherent designs!

- Dissonance of capacities of different transportation types
- Shared Space and Streamline -> hierarchy in rush hour
- More comfort with autom. Luggage transport-> more traffic caused by additional vehicles
- Recovering space by eliminating parking -> Traffic increase by arrival and departure
- High level of interdisciplinarity is unavoidable

Kapazitätsdissonanz on the Platform

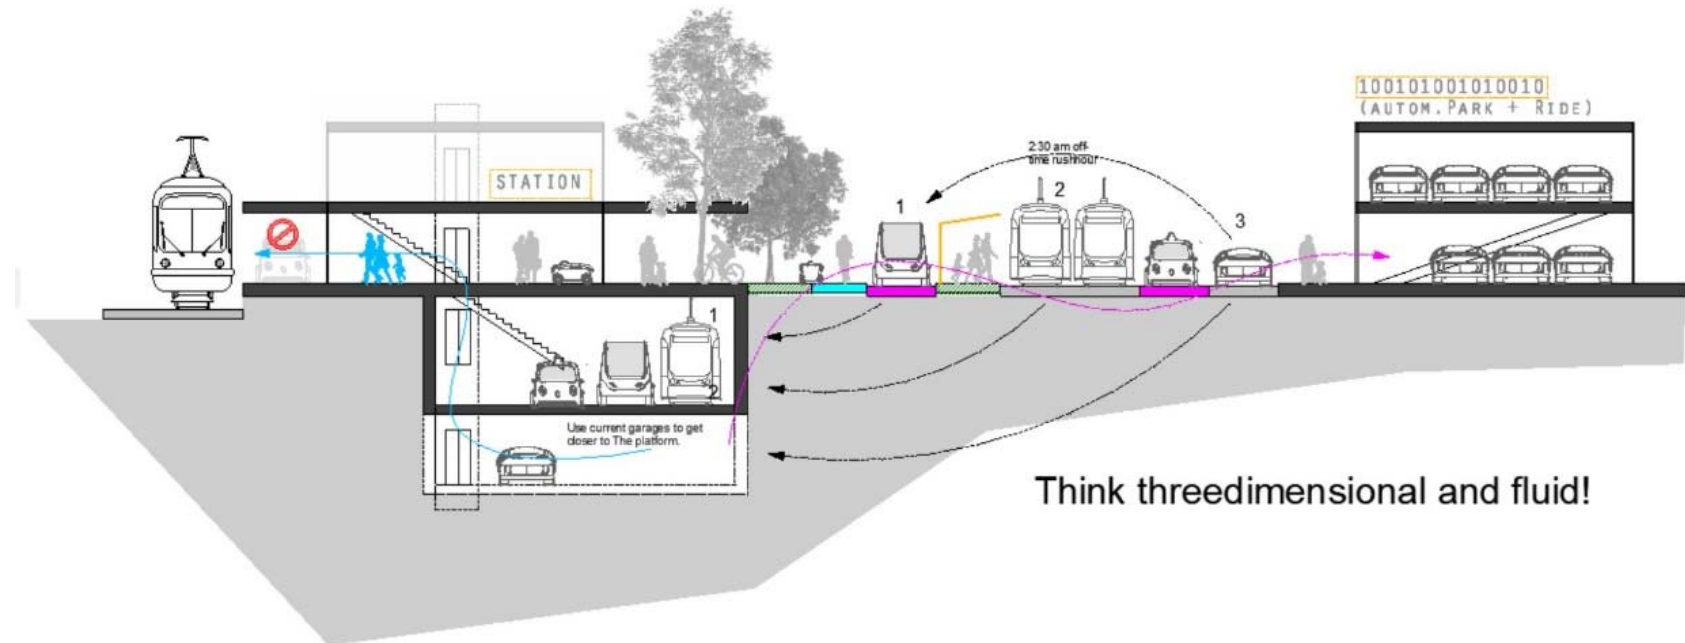

Existing situation on the Hub

- Strong separation effect and long ways for park and ride users.
- Existing strategies transferred public transport into the underground to shorten the distances

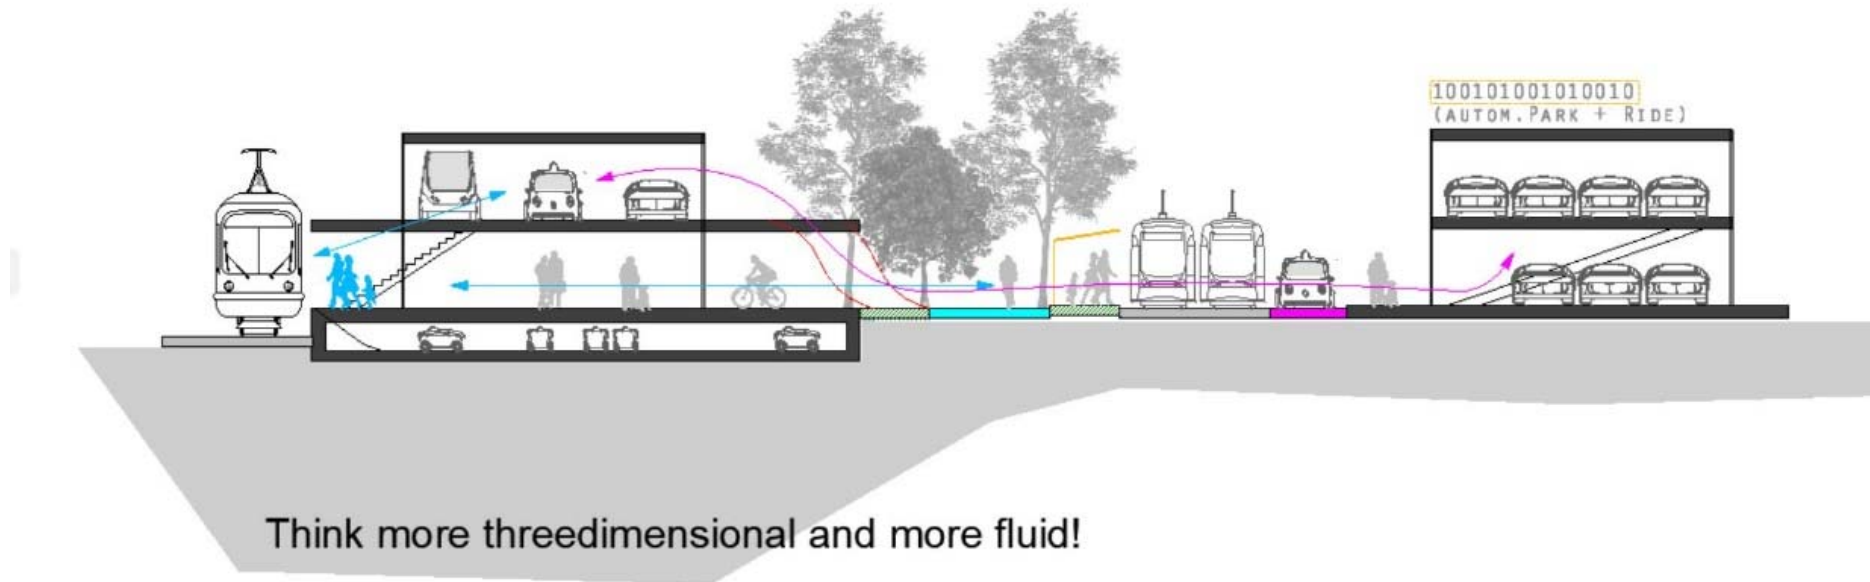

Future situation on the Hub

- Potential 1: Pod Cars and Shuttles could also use existing underground lanes to get closer to platform
- Potential 2: valetparking technology – cars can store themselves in existing garages, the P+R user can be closer to the station.

Extrapolation of the future situation on the Hub

- Ramps can introduce a second layer above the station to minimize the distance to Platform
- The (expensive) underground infrastructure is only dedicated to the transport of goods

Visionary Building as transportation Hub

- Yokohama Port Terminal by Foreign Office Architects, built in the end of the 1990ties

Perspective of a hub on two levels
